Name :	Bala Krishnan
Roll Number :	CS 003

PART - A

Q1

Encapsulation :

Encapsulation is the process of combining data and functions inside a class.

It helps to protect data

Q2

Inheritance.

Inheritance is the process of getting properties from another class. It helps reduce code

Q3 Constructor:

A constructor is a special function in a class. It is automatically alled when an object is created.

Q4 Polymorphism:

Polymorphism means many forms. The same function can work in different ways.

Q5 Data Abstraction:

Abstraction means hiding implmentation details and showing only necessary information to the user.

PART - B

Q6 Inheritance allows one class to use properties and functions from another class

Example:

```
class Animal {
    public:
        void eat() {}
};
class Dog : public Animal{
};
```

Here Dog can use the features of Animal. This reduces code duplication and improves code reuse

Q7

Encapsulation provides data hiding, It keeps data safe from direct access. Private variables cannot be accessed directly from outside the class. Public methods can be used to access them.

Example:

```
class Student {
    private:
        int mark;
    public:
        void setMark (int m) {
    mark = m;
  }
};
```
