

Name : Ganga

Roll Number : CS002

PART - A

Q1

Encapsulation :

* Encapsulation is a ~~is~~ class in C++

* It is used in object oriented programming

Q2

Inheritance is when one class uses another class.

It is useful in programming.

Q3

A constructor is a function inside a class.

Q4

Polymorphism means many forms.

Q5

Abstraction means hiding something.

PART - B

Q6

Inheritance is used in c++ programs. It is related to classes and objects. There are parent classes and child classes.

Ex:

```
class A{  
};
```

```
class B : public A{
```

```
};
```

Inheritance is useful because it is used in object oriented programming.

Q7

Encapsulation provides security

It keeps data safe

It is an important concept in c++

Example:

```
class student{
```

```
    private .
```

```
        int mark;
```

```
};
```

Q8

- * Compile-time polymorphism happens before the program runs
- * Run time polymorphism happens when the program runs
- * Function overloading is compile-time polymorphism
- * Virtual functions are run-time polymorphism
